Tonewood Database

ANNOUNCING THE TONEWOOD DATABASE

Announcing the Guitarbench Tonewoods Database. Each week, starting from the 28/8/8, we will feature a different tonewood - from plain old sitka spruce to wambo, our goal is to create a comprehensive resource for those seeking knowledge on tonewoods!

How to use the database

1. Listings are alphabetical according to the most common trade name. Scientific names are also included.
2. Listings have are headed by the Species, followed by the articles available under. Articles can be profiles and any relevant feature articles, the relevance will be stated next to the listing.
3. Feel free to link or use the data. You do not need to request permission to use or quote it as long as we are linked and cited.

Reference information

1. **Janka** stands for the Janka Wood Hardness Rating. It is a good measure of the durability and workability of a wood species. Wikipedia best explains what the test involves.
The test measures the force required to embed a 11.28 millimeter (0.444 inch) steel ball into wood to half its diameter. We give our Janka rating the United States conventional units of pounds-force (lb) unless stated. The units of measurement differ from country to country and can cause some confusion.
We also quote all of our Janka ratings at 12.5% moisture content as green wood has a lower Janka which is not relevant for tonewoods as only dried woods are used!
2. **Specific gravity** is best defined as the density of a substance compared to that of water. It is most accurately defined as "the ratio of the density of a given solid or liquid substance to the density of water at a specific temperature and pressure, typically at 4°C (39°F) and 1 atm (14.7 psi)", making it a dimensionless quantity." (wikipedia). Hence, any wood with an SG > 1 is denser than water and vice versa.
2. **RIVL** stands for Recommended If You Like. This is our opinion on which other woods this particular species is like.
3. **Bling factor**. Descriptive terms used to explain.
